Career & Interview Coach

HAI Term Project 2026

Week 3 & Week 4 check-in

Practice support —
not a hiring decision

Our HAI Principle

Fair to every user

Clear, evidence-based feedback

Never promise a job

Three Fictional User
s

BEGINNER

short, clear steps

easy to follow

builds confidence

INTERMEDIATE

targeted practice

realistic scenarios

actionable feedback

ADVANCED

evidence and rationale

customise experience

challenge feedback

Persona A — (below typical technical level)

Background: A student applying for an internship.

- AI experience: Beginner.
- Device: Uses an Android phone with a slow and unreliable internet connection .
- Goal: Improve one part of their CV and learn the next step.
- Problems: Difficult words, long answers, and fear of being treated unfairly.
- Feelings about AI: Interested but careful.
- Needs: Short, clear steps, easy words, keyboard-friendly controls, and extra details only when needed.
- Success: Can make one useful change to their CV and understand why it helps.

Persona B — (typical technical level)

Background: Final-Year Student looking for a job.

- AI experience: Intermediate.
- Device and internet: Laptop with Unstable Wi-Fi.
- Goal: Practice interview questions and get useful feedback.
- Problems: General advice and not knowing if a score means he will get the job.
- Feelings about AI: Interested but not fully trusting it.
- Needs: Clear examples, simple scoring rules, and a reminder that AI feedback does not guarantee a job.
- Success: Improves one interview answer using specific feedback.

Persona C — (advanced technical level)

Background: Graduate has used AI tools before.

- AI experience: Has experience using AI.
- Device and internet: Laptop with stable internet.
- Goal: Compare answers using clear scoring rules and question weak feedback.
- Problems: Unclear scores, settings that cannot be changed, and no way to challenge feedback.
- Feelings about AI: Comfortable using AI but wants proof and control.
- Needs: Clear scoring rules, the ability to change feedback settings, and a way to report or challenge unfair feedback.
- Success: Checks the evidence, changes the feedback focus, and explains why a correction is needed.

How We Check for Bias

Planned checks, not results

Use the same CV and job description

Change only the fictional name

Compare scores, evidence, tone, and advice

Review across groups for fairness

Bias Check Notes

1. Names & CulturePotential Issue: Names may affect scores or feedback.Planned Check: Test identical CVs with different fictional names.

2. CV & EducationPotential Issue: Writing style or university name may cause unfair judgments.Planned Change: Focus on skills and experience, not university reputation.

3. Gender & PronounsPotential Issue: Gender assumptions may affect feedback or encouragement.Planned Change: Use neutral language and test different pronouns.

4. AccessibilityPotential Issue: Complex text may be difficult for some users.Planned Change: Use simple language, clear headings, and keyboard navigation.

5. Devices & InternetPotential Issue: Users may lack a laptop or fast internet.Planned Change: Keep the system lightweight and show clear error messages.

6. Feedback & Score MeaningPotential Issue: Users may mistake the score for their actual hiring chances.Planned Change: Explain that the score does not predict hiring chances or guarantee results.

Our Test Data

10 fictional CVs

5 fictional job descriptions

Entry-level roles

No real applicants' personal data

Proposed dataset —
still to be created

Data source description

The project will use a small synthetic dataset created by the team. It will contain fictional resumes and fictional job descriptions designed specifically for testing the AI Resume Analyzer & Career Copilot.
The initial dataset will contain 10 fictional resumes and 5 fictional job descriptions covering entry-level roles such as Machine Learning Intern, Data Analyst Intern, and Junior Software Developer.
Each resume will contain fictional skills, education, projects, and experience. Each job description will contain fictional responsibilities and required or preferred skills. The team will use these records to test resume-to-job matching, missing-skill identification, explanation quality, and consistency across different fictional profiles.
Because the dataset will be created by the team using invented information, it will not contain real applicants' personal data. The team will document the dataset structure, the number of records, and its intended use. No external dataset license will be claimed for the team-created records; any third-party material added later will be checked for its applicable license and permissions.
This dataset fits the project track because it enables controlled, repeatable tests of resume analysis and job matching while reducing privacy risks.
Dataset status: Proposed. The team must create the records before reporting the dataset as completed.

Three
User Journeys

START → ASK → UNDERSTAND → ACT / FIX → FINISH

1. BEGINNER

Simple feedback
to build confidence

2. PRACTICER

Practice answers
and improve
performance

3. SKEPTIC

Check evidence
and challenge
weak advice

Evaluation Plan

We will measure how well the coach supports users with fair, reliable, and **evidence-based** guidance.

≥85% **Evidence Support** of feedback claims linked to CV or answer evidence

≥80% **Next-Step Understanding** of users can identify a concrete next step

≤5% **Fairness Failure Rate** point review threshold for fairness consistency

≥95% **Safe Handling** of unsupported or high-impact requests handled safely

These are planned targets, not measured results.

Our HAI
Principle Ladder

04 **enable feedback**
let users report bad advice

03 **allow control**
let users change feedback focus

02 **explain**
show the evidence

01 **inform**
say what AI can and cannot do

Tools and Safety Plan

A simple system built for trust

Clear checks at every step

Safe by design,always

Web page

HTML
CSS
JavaScript

Backend

Python
FastAPI

Mode
l

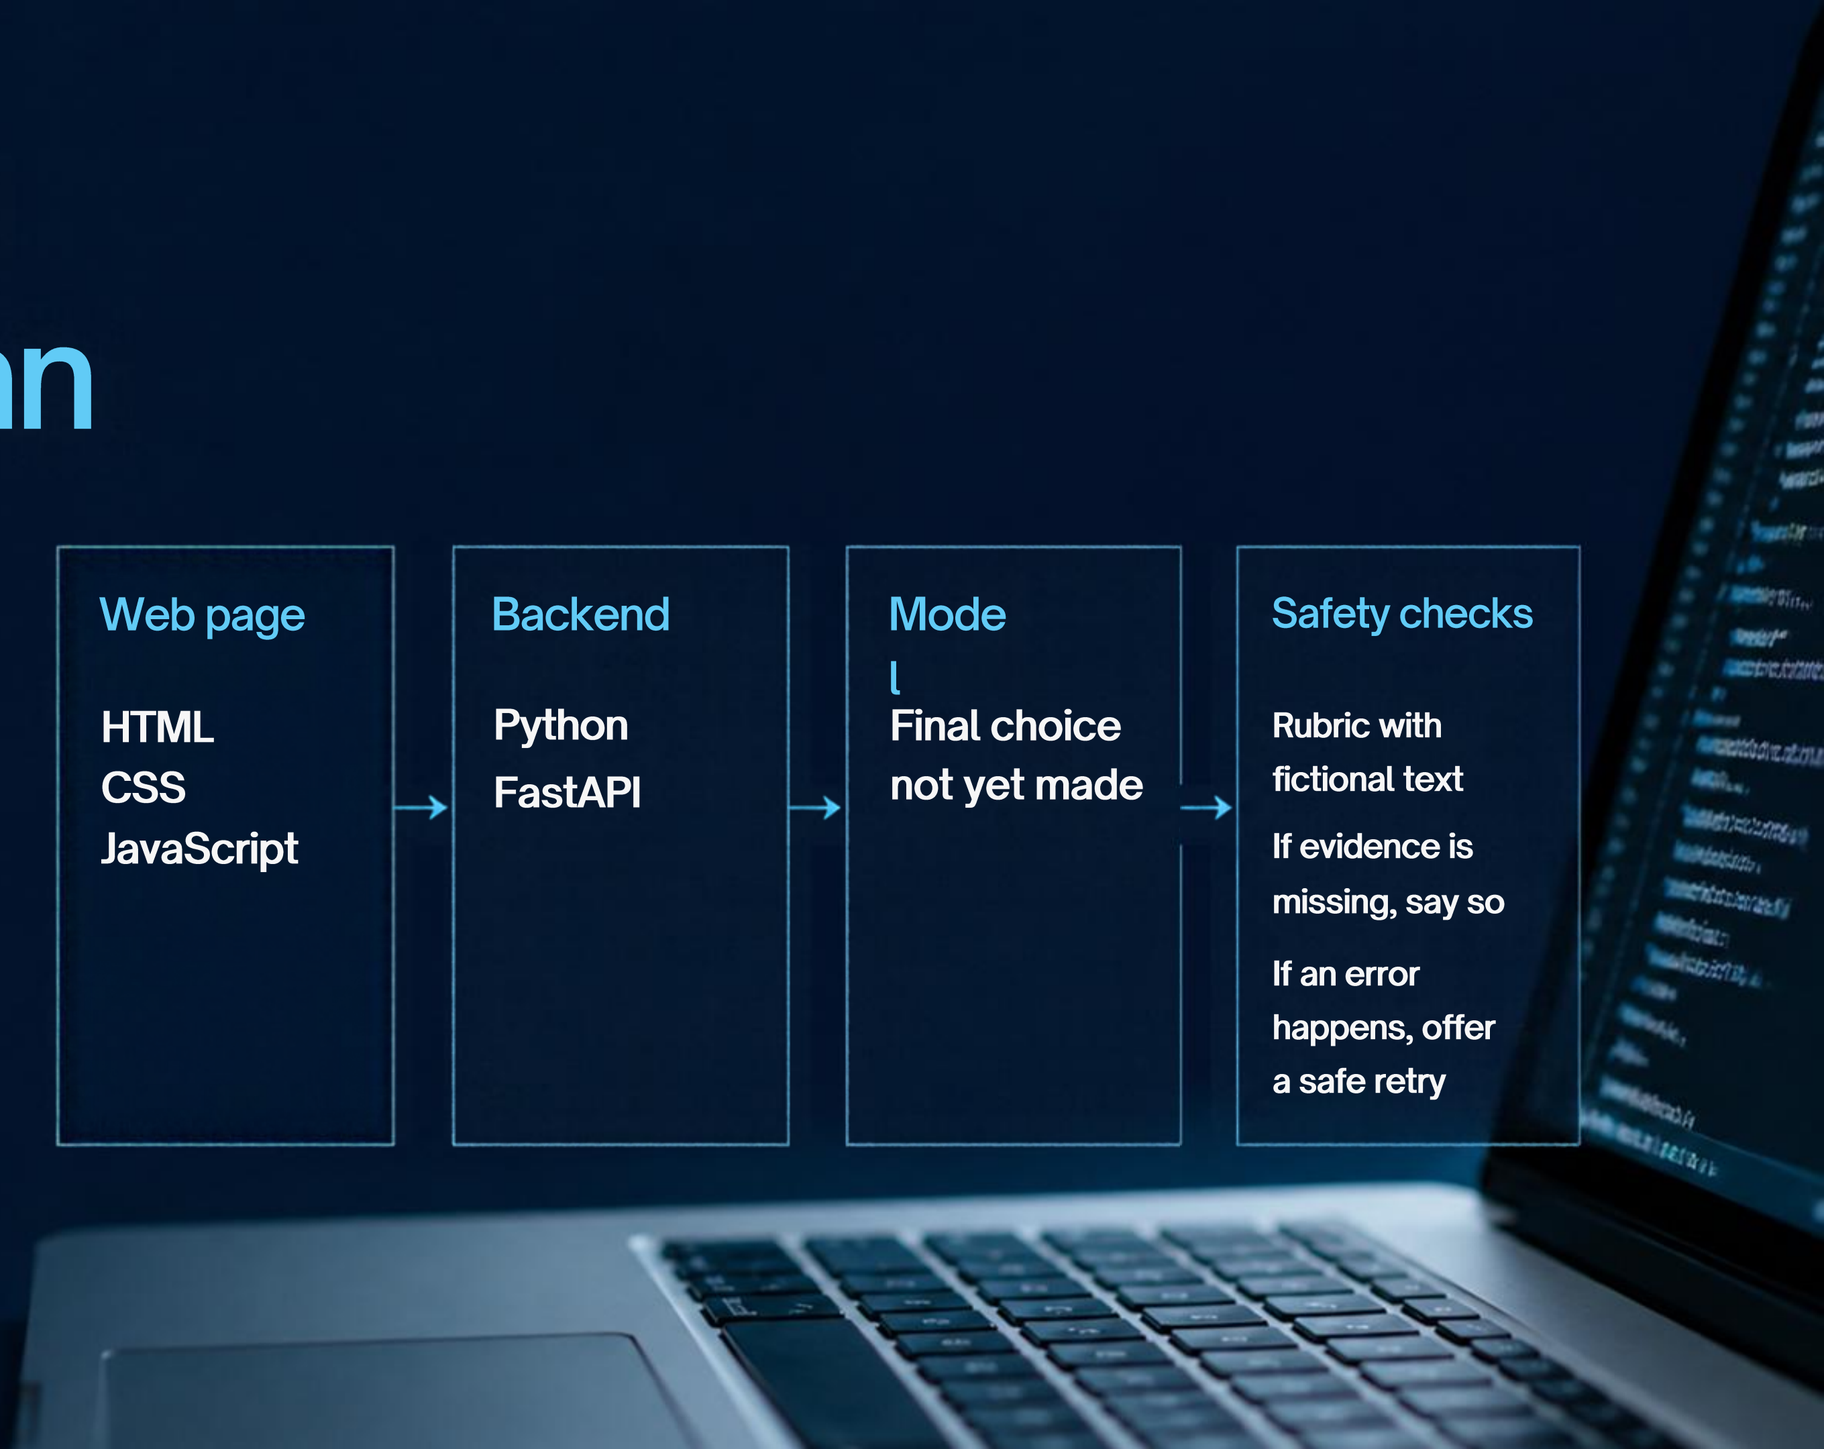

Final choice not yet made

Safety checks

Rubric with fictional text

If evidence is missing, say so

If an error happens, offer a safe retry

Evidence, Uncertainty & Safe Responses

Supported	Link every insight to a specific CV bullet or interview answer
Unclear	Separate what's observed from what's interpreted
Missing	Flag information gaps and ask clarifying questions
Safe by Design	No hiring predictions, no inferences about protected traits, and no recruiter decisions — ever

Feedback, Appeal & User Control

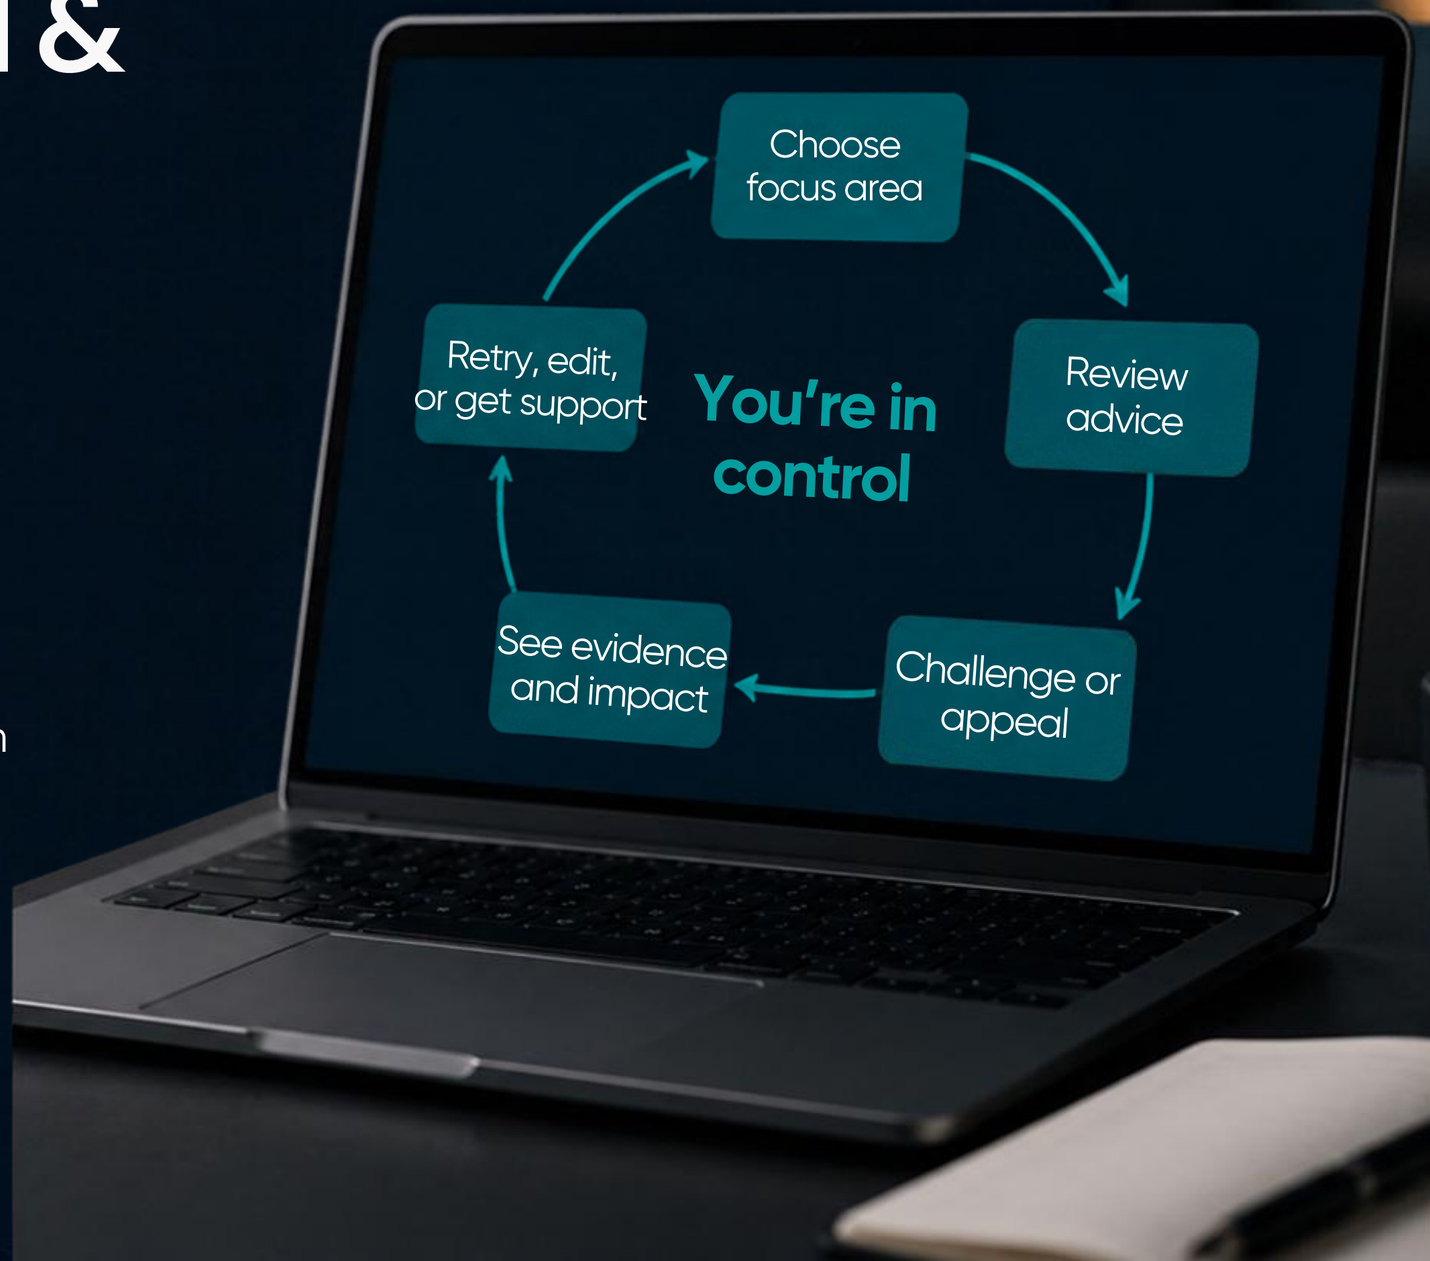

Choose what to improve and steer the feedback to what matters most

Challenge advice that’s incorrect, irrelevant, or unsupported

See the evidence behind each recommendation and what would change it

Corrections are tracked to improve accuracy and patterns are reviewed

Retry, edit your input, or request human support when available

PROMPT LOG

REPRODUCIBLE EVIDENCE

Record each prompt run with the exact inputs, tool, date, version, and purpose.

Summarize the actual output after running; never log expected results.

Document the team's revision and the reason behind it.

Maintain a consistent log across tools and experiments.

Cover core themes: personas, bias review, synthetic evaluation, objectives, principles, and fairness tests.

	TOOL	RRQMPT	DATE /VERSION	TEST INPUT	PURPOSE	OUTPUT SUMMARY	REVISION & WHY
PL-001	ChatGPT	Create a fictional persona for mock interview practice.	2026-04-10 v1.0	Student profile A	Person generation	Generated persona with background, goals, challenges.	Refined tone to improve realism.
PL-002	ChatGPT	Review for potential bias in interview questions.	2026-04-11 v1.1	Question set B	B1s review	Flagged based wonderly and improvised alternatives.	Reworded questions for fairness.
PL-001	Claude	Build a synthetic person for mock interview practice.	2026-04-12 v1.0	Rubi; Data Analyst	Evaluation creation	Produced scenarios, rubric, and scoring criteria.	Added edge cases to rubric.
PL-004	Gemini	Define measurable objectives for interview coach.	2026-04-13 v1.2	Project goals	Objective setting	Listed measurable objectives for clarity, metrics.	Adjusted metrics for clarity.
PL-005	Periplety	Run name-swap fairness test and compare results.	2026-04-14 v1.7	Paired CVs	Fairness testing	Showed score differences across name pain.	Added more name pair combinations.

FAILURE HANDLING & SAFE BOUNDARIES

System safety is embedded in the workflow, not just the interface.

NO HIRING GUARANTEES: The tool cannot predict or guarantee outcomes.

Redirect protected-trait requests to job-relevant criteria.

Identify missing evidence instead of filling gaps with guesses.

Use SYNTHETIC EXAMPLES for evaluation; keep raw CVs out of logs and Git.
